

Example code (6 examples with their outputs)

Example 1: Simple code

```
a<-1
print a + 1
print 'hello world'
end
>>2
>>"hello world"
```

Example 2: Reading an input from the keyboard

```
read a
print a
end
```

Example 3: Defining a simple function

```
Func[a] -> return a * 2
do Func[1]
print Func
end
>>2
```

Example 4: Declaring and using an array and freeing memory

```
a<- [1] + [2] + [3]
print a/0
a<- a*1
print a/0
->a
print a
end
>>1
>>2
>>Variable Var "a" not defined or is not in scope
```

Example 5: Import a library and using random

```
import Math
do Math.Pow[5 2]
print Math.Pow
a<- random 5
print a
end
>>25
>>random number a that is equal to 0,1,2,3 or 4
```

Example 6: Even parity for a set signal with a random error:

```
a<- [0] + [1] + [1] + [0] + [1]
Count[signal i sum] -> if i = length signal then return sum else sum<- signal/i +
sum i<- i + 1 do Count[signal i sum] return Count endif
do Count [a 0 0]
count <- Count
import Math
do Math.IsEven[count]
iseven<- Math.IsEven
if iseven = 1 then a<- a + 0 else a<- a + 1 endif
print a
inpt <- random length a
import Arrays
t<- a/inpt
do Math.Not[t]
t<- Math.Not
do Arrays.Change[a inpt t]
print Arrays.Change
a<-Arrays.Change
do Count[a 0 0]
count<- Count
do Math.IsEven[count]
temp<- Math.IsEven
if temp = 1 then
print 'no error detected'
else
print 'error detected in signal:'
print a
endif
end
```
