

Editor:

Simple editor implemented in Java, that allows the user to create, edit, save and run Snake programs, see their outputs and errors.

It includes a Run button, to run code, a Save button to save the code you have written in a file, the name of which you can chose by writing it in the text label next to the save button and a Load button, which looks for a file with the name written in the aforementioned text label and opens it (if it exists).

It also includes a scrollable text area, where you can write your code and an output area, where you can see the output of your code, after you run it and an error area where you can see the errors that the execution of your code produces. It can be run via the .app for macOS arm chips (it **will** have some issues with the data paths) or but putting all of the project files into a java editor and running the Snake editor from there.
